PARENT CASE DATA:

This application claims the benefit of U.S. Provisional Application No.
60/462,483, filed on Apr. 10, 2003, the disclosure of which is incorporated by
reference in its entirety herein.

NUMBER OF CLAIMS: 66 11 Figure(s).
DESCRIPTION OF FIGURES:

FIG. 1 schematically illustrates a troponin affinity tag and capture system of
this invention in an embodiment in which a **troponin C**
fusion protein is purified on a **troponin C** binding peptide
affinity matrix.

FIG. 2 illustrates key features of an embodiment of a **troponin**
C expression vector. PrT7 refers to the T7 promoter, T refers to a
thrombin recognition site, and MCS refers to a multiple cloning site.

FIG. 3 shows a Coomassie blue stained SDS-PAGE gel of a **troponin**
C (TnC)-Jol purification. A 12.5% Laemmli mini-gel was used with a
sample load of 5 μ L on a **troponin C** binding peptide
(TBP)-agarose column. Lane 1 shows the column load, lane 2 is representative of
the column flow-through fractions, lane 3 represents the column wash, and lanes
4-8 represent fractions from the elution after addition of EDTA.

FIG. 4 shows a Coomassie blue stained SDS-PAGE gel of a purification of a
TnC-La Delta C (rabbit skeletal muscle **troponin C** fused to
the N-terminus of a C-terminal truncated version of the human La/SSB autoimmune
antigen) fusion protein on a TBP-agarose column. A 12.5% Laemmli mini-gel was
used with a sample load of 5 μ L. Lane 1 shows the column load, lanes 25 show
column flow-through fractions; lanes 6-8 show column wash fractions, and lanes
9-14 show fractions from the elution after addition of EDTA.

FIG. 5 shows a Coomassie blue stained SDS-PAGE gel that illustrates the
purification of a **troponin C**-tagged full length La/SSB on a
TBP-agarose column. A 12.5% Laemmli mini-gel was used with a sample load of 5
 μ L. Lane 1 shows the column load, lanes 2-5 show column flow-through
fractions, lanes 6-8 show column wash fractions, and lanes 9-14 show fractions

from the elution after addition of EDTA.

FIG. 6 shows an SDS PAGE gel of TBP-La/SSB (lane 1), TnC-Jo1 (lane 2), TnC-La Delta C (lane 3), and TnC-La/SSB (lane 4), together with a corresponding Western blot probed with an antirabbit skeletal muscle **troponin** ***C*** antibody.

FIG. 7 illustrates key features of an embodiment of a TBP expression vector. PrT7 refers to the T7 promoter and MCS refers to the multiple cloning site.

FIG. 8 shows a Coomassie blue stained SDS-PAGE gel that illustrates the purification of a **troponin C** binding peptidetagged

C-terminal truncated La/SSB fusion protein on a **troponin C**

-sepharose column. A 12.5% Laemmli mini-gel was used with a sample load of 5 μ L. Lane 1 shows the column load, lanes 2-5 show column flow-through fractions, lanes 6-8 show column wash fractions, and lanes 9-14 show fractions from the elution after addition of EDTA.

FIG. 9 shows a Coomassie blue stained SDS-PAGE gel that illustrates the purification of **troponin C**-tagged Ro52 on a troponin

I-agarose column in the presence of 8M urea. Lane 1 shows the column load, lanes 2-4 show flow-through fractions, lanes 5-10 show column wash fractions, and lanes 11-15 show fractions of the elution after addition of EDTA.

FIG. 10 shows a comparison between purification of (A) Histagged La antigen (His-La) and (B) **troponin C**-tagged C-terminal truncated La antigen (TnC-La Delta C). Lane 1 shows the column load, lane 2 shows column flow-through, and lane 3 shows the peak fraction of eluted fusion protein. Arrows to the right of the figure illustrate breakdown products or incomplete translation products of the TnC-La Delta C fusion protein.

FIG. 11 shows a Coomassie blue stained SDS-PAGE gel that illustrates thrombin protease cleavage of a **troponin C**-tagged La Delta C molecule (TnC-La Delta C). Lane 1 shows untreated TnC-La Delta C. Lanes 2-5 illustrate thrombin cleavage of the fusion protein with increasing amounts of thrombin. Lane 5 demonstrates complete cleavage of the TnC tag from La Delta C. Lane 1: no thrombin. Lane 2: 0.0125 units thrombin. Lane 3: 0.025 units thrombin. Lane 4: 0.05 units thrombin. Lane 5: 0.1 units thrombin.

AB This invention pertains to the use of a novel set of tags for the immobilization and/or purification of proteins or other biological or organic molecules. The invention provides **troponin C**, **troponin C** binding peptide, and troponin I, or active fragments or analogues thereof as convenient tags and affinity ligands for immobilizing, attaching, or purifying proteins or other molecules. Methods for producing troponintagged molecules, such as recombinant fusion proteins, are described. Methods for preparing a troponin affinity **matrix** that is capable of specifically binding its cognate ligand in the presence of calcium, and methods for using such a **matrix** to purify troponin-tagged molecules are also described.

CLMN 66 11 Figure(s).

FIG. 1 schematically illustrates a troponin affinity tag and capture system of this invention in an embodiment in which a **troponin C** fusion protein is purified on a **troponin C** binding peptide affinity **matrix**.

FIG. 2 illustrates key features of an embodiment of a **troponin C** expression vector. PrT7 refers to the T7 promoter, T refers to a thrombin recognition site, and MCS refers to a multiple cloning site.

FIG. 3 shows a Coomassie blue stained SDS-PAGE gel of a **troponin C** (TnC)-Jo1 purification. A 12.5% Laemmli mini-gel was used with a sample load of 5 μ L on a **troponin C** binding peptide (TBP)-agarose column. Lane 1 shows the column load, lane 2 is representative of the column flow-through fractions, lane 3 represents the column wash, and lanes 4-8 represent fractions from the elution after addition of EDTA.

FIG. 4 shows a Coomassie blue stained SDS-PAGE gel of a purification of a TnC-La Delta C (rabbit skeletal muscle **troponin C** fused to the N-terminus of a C-terminal truncated version of the human La/SSB autoimmune antigen) fusion protein on a TBP-agarose column. A 12.5% Laemmli mini-gel was used with a sample load of 5 μ L. Lane 1 shows the column load, lanes 2-5 show column flow-through fractions; lanes 6-8 show column wash fractions, and lanes 9-14 show fractions from the elution after addition of EDTA.

FIG. 5 shows a Coomassie blue stained SDS-PAGE gel that illustrates the purification of a **troponin C**-tagged full length

La/SSB on a TBP-agarose column. A 12.5% Laemmli mini-gel was used with a sample load of 5 μ L. Lane 1 shows the column load, lanes 2-5 show column flow-through fractions, lanes 6-8 show column wash fractions, and lanes 9-14 show fractions from the elution after addition of EDTA. FIG. 6 shows an SDS PAGE gel of TBP-La/SSB (lane 1), TnC-Jo1 (lane 2), TnC-La Delta C (lane 3), and TnC-La/SSB (lane 4), together with a corresponding Western blot probed with an antirabbit skeletal muscle **troponin C** antibody.

FIG. 7 illustrates key features of an embodiment of a TBP expression vector. PrT7 refers to the T7 promoter and MCS refers to the multiple cloning site.

FIG. 8 shows a Coomassie blue stained SDS-PAGE gel that illustrates the purification of a **troponin C** binding peptidetagged C-terminal truncated La/SSB fusion protein on a **troponin C**-sepharose column. A 12.5% Laemmli mini-gel was used with a sample load of 5 μ L. Lane 1 shows the column load, lanes 2-5 show column flow-through fractions, lanes 6-8 show column wash fractions, and lanes 9-14 show fractions from the elution after addition of EDTA.

FIG. 9 shows a Coomassie blue stained SDS-PAGE gel that illustrates the purification of **troponin C**-tagged Ro52 on a troponin I-agarose column in the presence of 8M urea. Lane 1 shows the column load, lanes 2-4 show flow-through fractions, lanes 5-10 show column wash fractions, and lanes 11-15 show fractions of the elution after addition of EDTA.

FIG. 10 shows a comparison between purification of (A) Histagged La antigen (His-La) and (B) **troponin C**-tagged C-terminal truncated La antigen (TnC-La Delta C). Lane 1 shows the column load, lane 2 shows column flow-through, and lane 3 shows the peak fraction of eluted fusion protein. Arrows to the right of the figure illustrate breakdown products or incomplete translation products of the TnC-La Delta C fusion protein.

FIG. 11 shows a Coomassie blue stained SDS-PAGE gel that illustrates thrombin protease cleavage of a **troponin C**-tagged La Delta C molecule (TnC-La Delta C). Lane 1 shows untreated TnC-La Delta C. Lanes 2-5 illustrate thrombin cleavage of the fusion protein with increasing amounts of thrombin. Lane 5 demonstrates complete cleavage of the TnC tag from La Delta C. Lane 1: no thrombin. Lane 2: 0.0125 units thrombin. Lane 3: 0.025 units thrombin. Lane 4: 0.05 units thrombin. Lane 5: 0.1 units thrombin.

AB The present invention relates to novel human secreted proteins and isolated nucleic acids containing the coding regions of the genes encoding such proteins. Also provided are vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The invention further relates to diagnostic and therapeutic methods useful for diagnosing and treating diseases, disorders, and/or conditions related to these novel human secreted proteins.

AB Compositions and methods of the invention use a novel transactivator methodology for manipulation of the molecular mechanisms of cell determination for the production of a cell with a neuronal phenotype. A recombinant transcription factor or transactivator that binds the RE1 promoter element, REST-transactivator, was constructed by replacing the repressor domains of the transcriptional repressor REST with a transcriptional activation domain. The RE1 binding transactivator was

designed to induce or manipulate the neuronal differentiation process.

AB The present invention discloses the use of the non-toxic cell-binding B subunit of CT (CTB), and holotoxin CT that is devoid of ADP-ribosylating activity, as adjuvants for enhancing transcutaneous immune response to a co-administered protein allergen. It was found that topical administration of CTB to mice induced serum antibody response against itself comparable to those evoked by CT, but was inefficient at promoting systemic antibody responses against an admixed prototype protein allergen. To the contrary co-administration of either CT or CTB with allergen led to vigorous antigen-specific T cell proliferative responses in lymph nodes draining the cutaneous site of administration and at distant systemic sites. Consistent with these observations, it was found that CTB selectively potentiated Th1-driven responses without affecting Th2-dependent responses. Cutaneously applied CT enhanced serum IgE responses to a co-administered allergen, while CTB partially suppressed epicutaneously induced IgE responses to the same allergen.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to the identification and use of polypeptides that bind to antibodies directed to a desired polypeptide of interest. Using natriuretic peptides and their precursors, and in particular BNP, as an example, the present invention describes a number of natriuretic peptides fragments produced in biological samples, most preferably blood-derived samples, that bind to antibodies directed to BNP. Because production of such fragments is an ongoing process that may be a function of, inter alia, the elapsed time between onset of an event triggering natriuretic peptide release into the tissues and the time the sample is obtained or analyzed; the elapsed time between sample acquisition and the time the sample is analyzed; the type of tissue sample at issue; the storage conditions; the quantity of proteolytic enzymes present; etc., such fragments may be used when both designing an assay for one or more natriuretic peptides, and when performing such an assay, in order to provide an accurate prognostic or diagnostic result.

AB The present invention provides methods and compositions for treating or preventing allergic reactions, particularly anaphylactic reactions. Methods of the present invention involve administering microorganisms to allergic subjects, where the microorganisms contain a recombinant version of the protein allergen. The recombinant version can be wild-type or may include mutations within IgE epitopes of the protein allergen. Preferably the compositions are administered rectally. Particularly preferred microorganisms are bacteria such as E. coli. Any allergen may be used in the inventive methods. Particularly preferred allergens are anaphylactic allergens including protein allergens found in foods, venoms, drugs and latex. The inventive compositions and methods are demonstrated in the treatment of peanut-induced anaphylaxis.

INFO.: US 2003-462483P P 20030410 AB This invention pertains to the use of a novel set of tags for the				

immobilization and/or purification of proteins or other biol. or organic mols.
The invention provides **troponin C**, **troponin C** binding peptide, and troponin I, or active fragments or analogs thereof as convenient tags and affinity ligands for immobilizing, attaching, or purifying proteins or other mols. Methods for producing troponin-tagged mols., such as recombinant fusion proteins, are described. Methods for preparing a troponin affinity **matrix** that is capable of specifically binding its cognate ligand in the presence of calcium, and methods for using such a **matrix** to purify troponin-tagged mols. are also described.

AB This invention relates to methods for mapping or otherwise identifying
the amino acid sequence and conformation of a portion of a protein that
is involved in ligand binding. This invention finds utility in the
process of elucidating the amino acid sequence and conformation of an
epitope of, for example, an antigen or an antibody that binds to the
antigen.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention describes compositions and methods designed to determine the presence or amount of biologically active natriuretic peptides, or their fragments, in a sample. The degradation of natriuretic peptides is an ongoing process that may be a function of, inter alia, the elapsed time between onset of an event triggering natriuretic peptide release into the tissues and the time the sample is obtained or analyzed; the quantity of proteolytic enzymes present; etc. This degradation can produce circulating amounts of natriuretic peptides having reduced or lost biological function. The present invention provides, inter alia, assays designed to accurately measure biologically active natriuretic peptides, and compositions to inhibit a previously unknown pathway for degradation of natriuretic peptides.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention comprises a method for producing libraries of expressible gene sequences. The method of the invention allows for the simultaneous manipulation of multiple gene sequences and thus allows libraries to be created in an efficient and high throughput manner. The expression vectors containing verified gene sequences can be used to transfect cells for the production of recombinant proteins. The invention further comprises libraries of expressible gene sequences produced using the method of the invention and expression vectors used in the construction of said libraries.

AB Disclosed herein are nucleic acid sequences that encode novel
polypeptides. Also disclosed are polypeptides encoded by these nucleic
acid sequences, and antibodies, which immunospecifically-bind to the
polypeptide, as well as derivatives, variants, mutants, or fragments of
the aforementioned polypeptide, polynucleotide, or antibody. The
invention further discloses therapeutic, diagnostic and research methods
for diagnosis, treatment, and prevention of disorders involving any one
of these novel human nucleic acids and proteins.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to a composition comprising a plurality of
cDNAs which are differentially expressed in treated human C3A liver cell
cultures and which may be used entirely or in part to diagnose, to
stage, to treat, or to monitor the progression or treatment of liver
disorders such as hyperlipidemia.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to the identification and use of
polypeptides that bind to antibodies directed to a desired polypeptide
of interest. Using natriuretic peptides and their precursors, and in
particular BNP, as an example, the present invention describes a number
of natriuretic peptides fragments produced in biological samples, most
preferably blood-derived samples, that bind to antibodies directed to
BNP. Because production of such fragments is an ongoing process that may
be a function of, inter alia, the elapsed time between onset of an event
triggering natriuretic peptide release into the tissues and the time the
sample is obtained or analyzed; the elapsed time between sample
acquisition and the time the sample is analyzed; the type of tissue
sample at issue; the storage conditions; the quantity of proteolytic
enzymes present; etc., such fragments may be used when both designing an
assay for one or more natriuretic peptides, and when performing such an
assay, in order to provide an accurate prognostic or diagnostic result.

AB This invention relates to novel pharmaceutically useful compositions
that bind to a biological molecule, having improved circulatory
half-life, increased avidity, increased affinity, or multifunctionality,
and methods of use thereof. The present invention provides a

pseudo-antibody comprising an organic moiety covalently coupled to at least two target-binding moieties, wherein the target-binding moieties are selected from the group consisting of a protein, a peptide, a peptidomimetic, and a non-peptide molecule that binds to a specific targeted biological molecule. The pseudo-antibody of the present invention may affect a specific ligand in vitro, in situ and/or in vivo. The pseudo-antibodies of the present invention can be used to measure or effect in an cell, tissue, organ or animal (including humans), to diagnose, monitor, modulate, treat, alleviate, help prevent the incidence of, or reduce the symptoms of, at least one condition.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention provides isolated nucleic acids molecules, designated 32544 nucleic acid molecules, which encode novel phospholipase family members. The invention also provides antisense nucleic acid molecules, recombinant expression vectors containing 32544 nucleic acid molecules, host cells into which the expression vectors have been introduced, and nonhuman transgenic animals in which a 32544 gene has been introduced or disrupted. The invention still further provides isolated 32544 proteins, fusion proteins, antigenic peptides and anti-32544 antibodies. Diagnostic methods utilizing compositions of the invention are also provided.

AB Polypeptides corresponding to stable, circulating degradation products of troponin I (TnI) are described. The fragments comprise a sequence of the N-terminus of native cardiac TnI with 95-115 amino acid and additionally include fragments lacking about the 20-30 N-terminal amino acids. Utilities of these fragments and antibodies thereto include sensitive detection of myocardial infarction and purification of antibodies sensitive to the detection of troponin I degradation products.

AB This invention relates to single-chain polypeptides and their genetic sequences comprising a human cardiac troponin I N-terminal fragment and **troponin C**. The N-terminal fragment may or may not have the intact N-terminus. The single-chain polypeptide may be expressed recombinantly, and a linker or spacer polypeptide or peptide may be interposed between the troponin sequences. The single-chain polypeptides have utility as controls or calibrators for troponin assays, for the purification of troponin subunits and as an antigen for the preparation of antibodies.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Molecules comprise (i) a polypeptide (such as calmodulin) which has calcium-dependent binding affinity for ligand and (ii) another polypeptide, the polypeptides preferably being joined by a peptide bond and produced by recombinant expression from a gene fusion. The molecules are useful in detection, immobilization, targeting and purification, cell-labelling, and band-shift assays for determining binding of a member of a specific binding pair (sbp) for complementary sbp member. For purposes of band-shift assays, polypeptide (i) need not have calcium-dependent binding affinity for a ligand, but should have a dissociation constant for a ligand of 10 nM or less, measured at a pH of between 6 and 9 at 20° C. In an alternative embodiment, a calmodulin-binding polypeptide which is, or is derived from, mastoparan is joined, as polypeptide (i) instead of a binding polypeptide, to the other polypeptide.
